

# A new Framework to enable rapid innovation in Cloud Datacenter through a SDN approach.

José Teixeira

A thesis submitted to the University of Minho in the subject of Informatics, for the  
degree of Master of Science, under scientific supervision of Prof. Stefano Giordano  
and Prof. Alexandre Santos

# Abstract

In the last years, the widespread of Cloud computing as the main paradigm to deliver a large plethora of virtualized services significantly increased the complexity of Datacenters management and raised new performance issues for the intra-Datacenter network. Providing heterogeneous services and satisfying users' experience is really challenging for Cloud service providers, since system (IT resources) and network administration functions are definitely separated. In this scenario, a recent approach to programmable networks (i.e., Software-Defined Networking - SDN) seems to be a promising way to satisfy DC network requirements[7]. SDN based architecture decouples control and data planes: the most deployed SDN protocol is OpenFlow (OF)[9][8], which allows to set into OF compliant switches forwarding rules established by a centralized intelligence called controller.

Since SDN allows to re-define and re-configure network functionalities (possibly up to the physical layer), the basic idea is to introduce a new framework that allows to develop and test new OpenFlowbased controllers for Cloud Datacenters and also new policies that enables a more efficient, agile, scalable and simple use of both VMs and network resources. # Chapter 1

## Introduction

### 1.1 Introduction

- DataCenter
- Cloud
- Cloud DataCenter
- SDN - Software define Networks
- Openflow
- ...

### 1.2 Motivation and objectives

- Understanding the basic features of SDN paradigm
- Studying the problematics in cloud DC VM allocations
- Apply the SDN paradigm to better exploit the DC resources
- Develop a framework for Cloud Datacenter emulation and new VM allocation policies
- ...

## **1.3 Dissertation layout**

In the present Chapter 1 - ...

# **Chapter 2**

## **State of art**

Usually background and related work ...

### **2.1 Available solutions**

Write something generic

#### **2.1.1 CloudSim**

#### **2.1.2 NetFPGA Emulation**

#### **2.1.3 Meridian**

#### **2.1.4 Networkcloudsim**

#### **2.1.5 Greencloud**

#### **2.1.6 icancloud**

## **2.2 Virtual Machine Allocation Policies**

# Chapter 3

## Architecture and design

Conceptual view and architecture of the proposed solution (implementation details can go into a different chapter, if required)...

### 3.1 Framework architecture

Generically talk about the architecture...

### 3.2 Framework modules: Mininet

#### 3.2.1 Topology Generator

#### 3.2.2 Traffic Generator

Describe each module, it's functionalities, limitations, how it can be used/improved (improved if the user wants to add new features)

- Talk generally about the traffic generator
- Talk about the one's we tried (pros and cons)

## **3.3 Framework modules: Controller**

Describe each module, it's functionalities, limitations, how it can be used/improved (improved if the user wants to add new features)

### **3.3.1 Topology Discovery**

### **3.3.2 OF Rules Handler**

### **3.3.3 Statistics Handler**

### **3.3.4 VM Request Handler**

### **3.3.5 VMM - Virtual Machines Manager**

### **3.3.6 Network Traffic Requester**

### **3.3.7 POX Modules**

### **3.3.8 User Defined Logic**

## **3.4 Framework modules: Web Platform**

Describe each module, it's functionalities, limitations, how it can be used/improved (improved if the user wants to add new features)

### **3.5 Framework modules: VM Requester**

Describe each module, it's functionalities, limitations, how it can be used/improved (improved if the user wants to add new features)

## **3.6 Using the framework**

### **3.6.1 Emulator**

Describe how to use the framework (emulation part) and how to access the API..

### **3.6.2 Real Environment**

Describe what changes in the real environment (the modules that are disabled and the ones that need to be enabled)

# **Chapter 4**

## **Framework extensions**

### **4.1 Enabling QoS**

#### **4.1.1 State of art: QoS in SDN**

#### **4.1.2 QoS in the framework**

## **4.2 Enabling Virtual Machine migration**

### **4.2.1 State of art: Virtual Machine Migration Policies**

### **4.2.2 Virtual Machine migration in the framework**

# Chapter 5

## Validation and tests

Usually test and validation of the proposed solution ...

### 5.1 Framework Validation

- Show how Bf goes against WF with server driven algorithm (show server occupation)
- Show how Bf goes against WF with network driven algorithm (show network occupation)  
(although the behaviour is similar is allow to say that net algorithm may use switch statistics)

## **5.2 Performance Evaluation**

Get the tests from the submitted paper.

## 5.3 Real environment tests

- Talk about the environment which was setup
  - Chosen hypervisor
  - Talk about Xen api and the alternative solution (ssh each server and run a script to clone the vm)
  - OpenVswitches VS NetFPGA problems
  -

## **5.4 Migration test**

Should they be included here or on the section "Enabling Virtual MACHine migration"?

# **Chapter 6**

## **Conclusions**

This chapter provides ...

### **6.1 Main contributions**

### **6.2 Future work**

# **Appendix A**

## **Name of the Appendix**

# **Bibliography**
